KEY FEATURES

- Complement to the regular BeGraft stent
- Novel sandwich layer design
- For use in complex lesions
- High radial force

The BeGraft Plus stent graft system is CE Mark approved for intraluminal chronic placement in iliac and renal arteries to restore and improve the patency and treatment of aneurysms, acute perforations, and acute ruptures and fistulas.

The BeGraft Plus, the newest member of the Bentley BeGraft family, is a double stent system with expanded polytetrafluoroethylene tubing between the stents and on the outer stent. With its high radial force and remarkable flexibility, the BeGraft Plus has exclusive stent properties that make it more suitable for complex and demanding endovascular lesions.

"With BeGraft Plus, we see a new generation of covered stents that offer us new options for the treatment of aneurysm disease," said Prof. Eric Verhoeven, MD, PhD, Head of the Department of Vascular Surgery, General Hospital Nuremberg, in Germany.

The BeGraft Plus is currently available across all CE Mark countries and will become available in several non-CE Mark countries throughout 2018. Lengths are available from 27 to 58 mm, including diameters from 5 to 10 mm. The BeGraft Plus is 7-F compatible up to a diameter of 8 mm and 8-F compatible for diameters of 9 and 10 mm. ■
