KEY FEATURES

- Unique covered stent with radiopaque markers
- Small profiles
- Outstanding flexibility
- High postexpansion capacity
- Adapts to tortuous arteries

The iCover balloon-expanding covered stent can adapt to tortuous vessels due to its high flexibility and outstanding postexpansion capacity. It also offers excellent visibility because it is the only balloon-expandable covered stent with radiopaque markers on the stent ends. iCover is encapsulated with CoverTech, iVascular's new proprietary technology, which attaches the inner and outer expanded polytetrafluoroethylene layers to ensure a complete encapsulation. iCover's small profile (6 F, up to 8-mm diameter) and good navigability facilitate the procedures.

Professor Vicente Riambau, MD, from Hospital Clinic Barcelona in Barcelona, Spain, commented, "iCover stands out for its excellent navigability and flexibility, and the radiopaque tantalum markers on its ends provide better visibility under x-rays, which enhances precision during implantation."

The iCover covered stent has received CE Mark approval. ■
